

Growing spring onions

ROCKET SCIENCE

23RD APRIL 2020

It's important that your spring onions have roots. You can use anything to plant into, even just one large pot.

METHOD:

- Cut the bottoms off your spring onions, a few centimetres from the roots.
- Get your containers ready. You can use toilet rolls cut in half and folded or even egg shells!
- Fill half your container with soil, hold spring onions in place with roots as low as possible and fill remaining space with soil.
- Add a little water. Keep soil damp. Sit containers in a larger container on a windowsill or similar.
- Within a few days you will see new green regrowth.
- After a week or two, plant them in a larger pot or garden bed.

- When you harvest your spring onions cut off what you need and leave the roots in the soil - it will keep growing back!
